TRUST PERCENTAGE TESTING:
This analysis tests different combinations of malicious
and corrupted peer percentages including a baseline
case (0% threats) to understand trust degradation.

CONFIGURATIONS TESTED:
Total configurations: 11
Includes baseline (0% threats) and threat levels 10-40%
```

TRUST METRICS EXPLANATION:
• FPR (False Positive Rate): Good nodes incorrectly removed / Total good nodes sent
• TPR (True Positive Rate): Malicious nodes correctly detected / Total malicious nodes sent
• FNR (False Negative Rate): Malicious nodes incorrectly confirmed / Total malicious nodes sent
• Accuracy: Overall system accuracy (correctly handled nodes / total nodes)

TRUST ANALYSIS INSIGHTS:
• Baseline case provides reference for system performance without threats
• Total threat level ranges from 0% (baseline) to 40%
• Different malicious/corrupted ratios at same total threat level
• System performance degradation under varying adversarial conditions
• Trust evaluation under different threat scenarios

TRUST PERCENTAGE PARAMETERS:
The malicious_percentage and corrupted_percentage parameters control
the proportion of adversarial peers in the federated learning system:
• Malicious peers: Have poor data quality and harm model performance
• Corrupted peers: Have degraded data quality but not malicious intent
• Baseline: 0% threats - ideal trust scenario
• Total threat = malicious% + corrupted%
• Higher percentages create more challenging trust environments
